Patent a	and Trademark Office			

Continuation of 10. Other: The Office has interpreted the body of the claim as a nanocrystalline metal oxide semiconductor film having at least one immobilized protein. Both Penth(USP 5,885,657) and the supplied translation of WO 96/00198 teach immobilization of at least one protein on the claimed surface. Applicant acknowledges the art teaches the claimed film and an immobilized protein, but maintains the art fails to teach the claimed biosensor. The Office maintains the art teaches the claimed combination in a sensing environment (e.g for the manurfacture of photovoltaic cells, electrodes, semiconductors, etc.). which has been read on the claimed sensor (because an enzyme is being immobilized this would read on a "biosensor"). Applicant might try to better define the structure of the biosensor in combination with the film.
